Forgotten Books, United States, 2015. Paperback. Condition: New. Language: English . Brand New Book ***** Print on Demand *****. Excerpt from *The Decennial Publication: Issued in Commemoration of the Completion of the First Ten Years of the University s Existence* As the living substance which constitutes the animal body becomes differentiated into distinct tissues, the animal as a whole becomes more highly organized. The fundamental tissues which are thus formed - namely, the epithelial, connective, muscular, and nervous - are distinguished by the fact that each of them exhibits one or more of the general characteristics of protoplasm developed to a greater or less degree, whereas other of the characteristics are much less evident or apparently entirely lacking. The combined activities of these differentiated tissues are exhibited in the life-history of the entire animal. For the understanding of such an animal it is important to know the proportions of the several tissues present in any instance, and whether we study the animal from the standpoint of the number and size of the cell elements which constitute each tissue, or from the more general standpoint of the weight of modified living substance possessing the peculiar physiological characteristics of the tissue, the animal could be described in terms of the analysis, that is, in quantitative terms of the several systems of tissues which compose it. Thus, when tested in this way, animals like the dog, rabbit, and cat are found to be dissimilar in their make-up, and a snake, for example, has a different tissue composition from a frog. To determine that these animals are thus differently constituted is merely a first step, and is naturally followed by the attempt to determine whether there are any laws governing the quantitative relations of these tissues either in the animal series or in the...
